7 Structured hypertext with domain semantics

Weigang Wang, Roy Rada
October 1998 **ACM Transactions on Information Systems (TOIS)**, Volume 16 Issue 4

Full text available:  [pdf\(593.99 KB\)](#)

Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

One important facet of current hypertext research involves using knowledge-based techniques to maintain document structures. A semantic net is one such technique. However, most semantic-net hypertext systems leave the linking consistency of the net to individual users. Users without guidance accidentally introduce structural and relational inconsistencies in the semantic nets. The relational hindrance hinders the creation of domain information models. The structural ...

Database management systems will continue to manage large data volumes. Thus, efficient algorithm accessing and manipulating large sets and sequences will be required to provide acceptable performance. The advent of object-oriented and extensible database systems will not solve this problem. On the contrary, data models exacerbate the problem: In order to manipulate large sets of complex objects as efficiently as database systems manipulate simple records, query-processing ...

Digital libraries (DLs) are complex information systems and therefore demand formal foundations. Efforts to formalize DLs have diverged and interoperability suffers. In this article, we propose the fundamental abstraction: Structures, Spaces, Scenarios, and Societies (5S), which allow us to define digital libraries rigorously. Streams are sequences of arbitrary items used to describe both static and dynamic (e.g., video) content. Structures can be viewed as labeled directed graphs ...

Additional Information: [full citation](#), [abstract](#), [references](#), [citing](#)

Distributed operating systems have many aspects in common with centralized ones, but they also differ. This issue is intended as an introduction to distributed operating systems, and especially to current university research of what constitutes a distributed operating system and how it is distinguished from a computer network. Several examples of current research projects are examined in some detail ...

19 Streams, structures, spaces, scenarios, societies (5s): A formal model for digital libraries

Digital libraries (DLs) are complex information systems and therefore demand formal foundations

interoperability suffers. In this article, we propose the fundamental abstractions of Streams, Structures (5S), which allow us to define digital libraries rigorously and usefully. Streams are sequences of a static and dynamic (e.g., video) content. Structures can be viewed as labeled directed gra ...
